In a semiconductor device such as an integrated circuit, a field isolation film is formed in a device forming region of a semiconductor substrate to define a device forming region. In the field isolation film, a groove is formed in an active region to provide a device isolating effect. A silicon oxide film or a silicon nitride film is formed by a low pressure chemical vapor deposition (LPCVD) method or a plasma CVD method to fill the groove. In recent years, as the integrated circuits become highly integrated, the device isolation capability by the field isolation film becomes insufficient. In a conventional method for manufacturing a semiconductor device, a field isolation film is formed to be thick to assure the device isolating capability. As a result, in a large scale integrated circuit, a step portion is formed in a device forming region due to a field isolation film formed in the device forming region. When a CMOS device is manufactured, a field isolation film having a sufficient thickness is formed in a region for forming a p channel MOS transistor and a region for forming an n channel MOS transistor. In the manufacture of a CMOS device, a p+ region is formed in a p channel region, and an n+ region is formed in an n channel region. The n+ and p+ regions are formed by using a boron impurity having a high concentration

Q: Should I go back to intermediate after learning architecture in C We have recently finished a chapter on architecture. I have implemented many algorithms using arrays and I have learnt how to solve any problem with arrays. When we started the architecture part, I was quite good at using an array to represent a class. But after that, I am very confused. It is even confusing for me as to how I should represent my data. I am struggling to show what I know to others. I think I should get back to intermediate (C) programming. If you have any advise/recommendations, I will be very thankful to you. A: In my opinion, this is perfectly fine. I used to
