The synth is in three modes: Unison, which allows the user to stack voices to get complex sounds with no groupings. Poly Voice, which enables multiple voices to be defined, similar to subtractive synthesis. Full Voice, which allows the user to use a single poly-voice for all the voices of the plugin. Three LFOs that can be synchronized, and each has 4 waveforms, plus velocity and envelope control, as well as two output levels. There are two oscillators: A standard sine wave and a triangle wave. The sine wave can be distorted via hard clipping, and a very wide variety of other effects can be applied via modulation of the output, eg the LFO. Clipping can be either soft, or hard. A large number of notes, up to 3112, can be played at once, in unison. Delay, chorus, reverb, and a stereo echo effect can be applied. There are two unison modes: One is a standard unison mode that is non-retriggerable, but can be stopped and started, and the other is a retriggerable unison mode that provides real-time responses to a key-press, a voice-change or the triggering of the Poly Voice modes. The string can be tuned via two parameters: A scale, which sets the pitch, and a tension, which adds harmonics and allows for deeper notes. Tuneable unison and layer modes can be applied to the strings to allow for complex sounds and timbres. A feature called Loop is also provided. It allows a note to repeat an arbitrary number of times. Bass-synth plugin. Requires a Synth Engine, a CPU in the order of 100MHz and 1MB RAM. For operation on low-power computers, use a different host software.
