Core Audio Description (CAD) is a proprietary multimedia framework in OS X that allows developers to access audio assets in a modular fashion and to manipulate them programmatically. CAD is used by Apple's Logic Audio and Pro Tools, and it's also the standard audio export format of all major DAWs (Digital Audio Workstations). However, besides its use in professional audio production software, Core Audio Description has recently become a popular audio format for iPhone and iPad apps, especially for games.

Apple's proprietary Audio File Formats Over the past decade, Apple has developed three audio file formats and a media library format specifically for audio playback. The File Type Extension (or extension) of a file indicates which format the file is in, and each format is associated with a specific file extension. Audio Interchange File Format (AIFF), H.264/MP4, and HE-AAC are the three file formats Apple offers for the playback of audio files. H.264 is a video compression format designed to store and play video streams in various resolutions, while HE-AAC is Apple's AAC format, which is a high-fidelity audio coding format. Apple has also developed a media library format, which is used to store any file format, including audio files. You can play audio files in the iPhone and iPad using all three file formats, but you will need to download an additional software, such as an audio player app, if you want to hear the AIFF, H.264/MP4 and HE-AAC formats.

Audio Interchange File Format (AIFF) AIFF is a file format used for storing and playing audio files. The AIFF format was developed by Apple in the early 1980s, and it's the oldest audio file format used on computers. The AIFF format is limited to 77a5ca646e
